

The WebGL Companion

book proposal for Taylor & Francis Group
philiprideout@gmail.com

Summary

The WebGL Companion guides readers through an essential set of rendering techniques and 3D interaction techniques, showcasing a set of small-but-complete web apps at the end of each chapter, with diagrams and screenshots printed in full color. This is not only the authoritative book on WebGL, it's also documentation for the upcoming *giza* graphics library, developed over the course of the book.

About the Author

Philip Rideout has worked in the field of real-time graphics for over ten years, having played roles at several pioneering graphics companies, including Intergraph, NVIDIA, and Pixar. He is the sole author of *iPhone 3D Programming* (O'Reilly Media), and a contributing author of *GPU Pro 2* (A K Peters) and *OpenGL Insights* (CRC Press).

Table of Contents

In the following outline, some section headings are colored **green**; these are tutorial-style *recipes* that demonstrate the techniques discussed in the chapter.

Contents

1	Preliminaries	6
1.1	A Brief History of *GL	6
	Gives an account of WebGL’s ancestry (OpenGL, OpenGL ES), motivation, and rapid growth. Also briefly mentions impediments at the time of writing, such as security concerns and IE support.	
1.2	Building Giza: Literate Programming	6
	Describes our coding conventions and the giza library that is developed over the course of the book.	
1.3	The Assembly Line Metaphor	6
	High-level overview of the WebGL rendering pipeline.	
1.4	The Canvas Element	6
	Explains the width and height attributes and how to handle retina displays.	
1.5	Animation Timing	6
	How to periodically trigger draw events.	
1.6	Recipe 1: Strobe Light	6
	The simplest possible WebGL application; animates a solid color with <code>clear</code> .	
2	Vertex Shading and Transforms	7
2.1	Vector Algebra with JavaScript	7
	This sections walks through giza’s implementation of vector and matrix classes. Rotation, translation, and scale are given a very brief treatment.	
2.2	Life of a Vertex	7
	Describes model, view, and projection transforms.	
2.3	Shading Language Basics	7
	Explains uniforms, attributes, and varyings. Walks through trivial <code>main</code> functions for vertex and fragment shaders.	
2.4	Line Drawing	7
	Explains the <code>LINES</code> primitive and <code>drawElements</code> .	
2.5	Typed Arrays, Vertex Attributes and VBOs	7
	Shows how heterogeneous data (e.g., colors and positions) can be interleaved and submitted to WebGL.	
2.6	Recipe 2: Color Graph	7
	Animated wireframe graph of the sinc function; illustrates performance differences between JavaScript-side computation and shader-side computation.	
3	Downloading and Applying Artistic Content	8
3.1	Texture Coordinates	8

	Quick overview of texture coordinates and wrap modes. For an example, shows how to apply a section of the Mona Lisa to a quad.	
3.2	Texture Filtering	8
	Explanation of minification, magnification, and mipmapping; uses small pixel art to illustrate the effects of filtering.	
3.3	Parametric Surfaces	8
	Procedural generation of simple geometry.	
3.4	Loading Mesh Data with XMLHttpRequest	8
	Implements Giza’s download functionality; also mentions <code>webgl-loader</code> .	
3.5	Recipe 3: Planet Mars	8
	Downloads a sphere mesh and a Mars texture; also demonstrates <code>WEBGL_compressed_texture_s3tc</code> .	
4	Rendering and Lighting Solid Objects	9
4.1	Face Orientation	9
	Explains polygon winding, <code>CULL_FACE</code> (used in the Planet Mars recipe) and <code>gl_FrontFacing</code>	
4.2	Dealing with Depth	9
	Explains the depth buffer and how depth artifacts can arise.	
4.3	Surface Normals	9
	Extends the “Parametric Surfaces” sample to compute surface normals.	
4.4	Lambertian Reflection	9
	Illustrates a simple ambient-diffuse-specular lighting model.	
4.5	Recipe 4: Cel Shading	9
	Applying standard lighting, then snapping the color gradient to a few colors for cartoon-style rendering.	
5	Framebuffer Effects, Part I	10
5.1	Alpha Blending	10
	Explains the different blend modes; also discusses back-to-front sorting and screen-door transparency with <code>discard</code> .	
5.2	Framebuffer Objects	10
	How to create offscreen render targets.	
5.3	Floating Point Textures	10
	Explains unclamped colors (<code>OES_texture_float</code>) and how they can be used for general-purpose computation.	
5.4	Subsurface Scattering	10
	Rendering translucent marble with floating point textures.	
5.5	Gaussian Blur	10
	Optimal filtering with minimal taps.	
5.6	Stencil Buffer	10
	Brief overview of stencil and how it can be used for CSG and shadows – also mentions <code>WEBGL_depth_texture</code>	
5.7	Recipe 5: Mughal Window	10
	Illustrates stenciled fake reflection, a depth-based glass effect and a jaali screen backdrop with HDR bloom.	

6	Framebuffer Effects, Part II	11
6.1	Distance Blur	11
	Depth of field via post-processing; also mentions a jitter-based technique.	
6.2	Ambient Occlusion	11
	Screen-space ambient occlusion.	
6.3	Shadow Maps	11
	Old-school PCF shadow mapping.	
6.4	Heat Shimmer	11
	Using the fragment shader to create a heat wave effect.	
6.5	Recipe 6: Desert Scene	11
	Rotates the camera around a static desert scene that uses all the techniques discussed in this chapter.	
7	Texture Tricks, Part I	12
7.1	Point Sprites	12
	Show how to use point sprites and vary their size from the vertex shader.	
7.2	Derivatives Extension	12
	Shows how fragment shaders can smooth the edges of procedural patterns using <code>OES_standard_derivatives</code> .	
7.3	Recipe 7: Tube Sparks	12
	Flies the viewer through a tube with stripe patterns. Point sprites are used to render spinning spark patterns inside the tube.	
8	Texture Tricks, Part II	13
8.1	Reflection and Refraction with Cubemaps	13
	Classic, simple use of cubemaps.	
8.2	Normal Mapping	13
	Bumps and dimples in tangent space.	
8.3	Using the Webcam	13
	Capturing video in real time and using it as a WebGL texture.	
8.4	Anisotropic Filtering	13
	High-quality rendering of nearly edge-on geometry using <code>EXT_texture_filter_anisotropic</code> .	
8.5	Recipe 8: Movie Theater	13
	Displays a dimpled glass ball that refracts the webcam image.	
9	Interaction Techniques, Part I	14
9.1	Trackball Rotation	14
	Classic mouse-driven rotation.	
9.2	Selection Buffer	14
	Render object IDs into a FBO.	
9.3	Inverse Kinematics	14
	Shows how to animate an articulated skeleton. This is a high-level overview only, since giza's IK implementation is quite math-heavy.	
9.4	Vertex Skinning	14
	Render soft joints by blending multiple vertex transformations.	
9.5	Recipe 9: Dancing Manikin	14
	Allows users to interact with a stick figure by dragging its hands and feet.	

10 Interaction Techniques, Part II	15
10.1 View Cube	15
Move the camera by clicking hotspots on a cube.	
10.2 Manipulators	15
Interactive handles for positioning objects.	
10.3 Überlight	15
Spotlight effects with superellipsoid shapes.	
10.4 Recipe 10: Stage Dressing	15
Allows users to translate, rotate, and resize objects in a scene.	
11 Beyond Giza: Related Libraries	16
11.1 three.js	16
By far the most popular 3D JavaScript library. It's higher level than giza, making it easy to create simple demos. It also provides support for non-WebGL rendering (eg, canvas or SVG rendering).	
11.2 dat-gui	16
Overlay interface for tweaking variables.	
11.3 glMatrix	16
Fast vector math from Brandon Jones.	
11.4 danser.js	16
Create music-based animation.	
11.5 tween.js	16
Robert Penner's animation equations.	

1

Preliminaries

- 1.1 A Brief History of *GL
- 1.2 Building Giza: Literate Programming
- 1.3 The Assembly Line Metaphor
- 1.4 The Canvas Element
- 1.5 Animation Timing
- 1.6 **Recipe 1: Strobe Light**

2

Vertex Shading and Transforms

- 2.1 Vector Algebra with JavaScript
- 2.2 Life of a Vertex
- 2.3 Shading Language Basics
- 2.4 Line Drawing
- 2.5 Typed Arrays, Vertex Attributes and VBOs
- 2.6 **Recipe 2: Color Graph**

3

Downloading and Applying Artistic Content

- 3.1 Texture Coordinates
- 3.2 Texture Filtering
- 3.3 Parametric Surfaces
- 3.4 Loading Mesh Data with XMLHttpRequest
- 3.5 **Recipe 3: Planet Mars**

4

Rendering and Lighting Solid Objects

- 4.1 Face Orientation
- 4.2 Dealing with Depth
- 4.3 Surface Normals
- 4.4 Lambertian Reflection
- 4.5 **Recipe 4: Cel Shading**

5

Framebuffer Effects, Part I

- 5.1 Alpha Blending
- 5.2 Framebuffer Objects
- 5.3 Floating Point Textures
- 5.4 Subsurface Scattering
- 5.5 Gaussian Blur
- 5.6 Stencil Buffer
- 5.7 **Recipe 5: Mughal Window**

6

Framebuffer Effects, Part II

- 6.1 Distance Blur
- 6.2 Ambient Occlusion
- 6.3 Shadow Maps
- 6.4 Heat Shimmer
- 6.5 **Recipe 6: Desert Scene**

7

Texture Tricks, Part I

7.1 Point Sprites

7.2 Derivatives Extension

7.3 Recipe 7: Tube Sparks

8

Texture Tricks, Part II

- 8.1 Reflection and Refraction with Cube-maps
- 8.2 Normal Mapping
- 8.3 Using the Webcam
- 8.4 Anisotropic Filtering
- 8.5 **Recipe 8: Movie Theater**

9

Interaction Techniques, Part I

9.1 Trackball Rotation

9.2 Selection Buffer

9.3 Inverse Kinematics

9.4 Vertex Skinning

9.5 Recipe 9: Dancing Manikin

10

Interaction Techniques, Part II

- 10.1 View Cube**
- 10.2 Manipulators**
- 10.3 Überlight**
- 10.4 Recipe 10: Stage Dressing**

11

Beyond Giza: Related Libraries

- 11.1 `three.js`
- 11.2 `dat-gui`
- 11.3 `glMatrix`
- 11.4 `danser.js`
- 11.5 `tween.js`
